

Two Opposing World Views

The conflict between the theory of evolution and the Christian faith should not surprise anyone. The biblical account in Genesis 7 and 8 describes a global flood that took place about 4400 years ago. The theory of evolution cannot allow for a global flood, and thus the two world views are complete opposites.

Evolutionists consider the global flood of Noah's day to be a myth and say so in their literature. In saying this they are admitting they do not believe the Genesis account and how God used Noah to build an ark that saved mankind and the animals. Why can't they believe the bible, because science is guided by a doctrine known as Naturalism, which states that one cannot invoke a supernatural act to explain the physical world? Therefore, biblical world history must be rejected in favor of their new naturalistic world view.

Here is the interesting part of this conflict. Scientists know there was a global flood but choose to ignore the facts. The cretaceous layer consists of marine organisms which can only happen in water. It is the one layer of the geologic column that is universal, stretching from continent to continent. That tells us one thing; the whole world must have been under water at the same time. This is known as the K-T boundary, where there were massive extinctions. A global flood destroys the scientific community's entire thesis of origins and that is why only one side of this argument is allowed in the classroom.
