

## Starting over

Jews and Christians throughout history have believed that there was a global flood as recorded in the book of Genesis. Science teaches that the global flood of Noah's day is a myth. So who is right?

If there was a global flood, how would it affect the earth? It would destroy everything on land; plants, trees, river systems and civilizations. Nothing would survive and everything would have to start over again.

1. The Velvichiya are the oldest plants known to man. The oldest are about four to five thousand years old.
2. The oldest trees, the Bristlecone Pines and Redwoods, are also four to five thousand years old.
3. The age of a river can be determined by measuring the amount of silt that it deposits on a yearly basis in relation to the overall size of its delta. The oldest river systems are four to five thousand years old.
4. Some will say that there are civilizations that are much older than four to five thousand years old. Yes, that is what science used to teach, but look at what has happened to the dates in China, Egypt and Mesopotamia. The ages keep getting shorter and shorter and now are in the five thousand year range.

The evidence seems to indicate that the Earth's clock was reset to zero about four to five thousand years ago. But only a worldwide catastrophe could create this kind of scenario. Isn't it interesting that the global flood recorded in Genesis occurred about 5000 years ago.
